

Transcript – Logic modelling

Logic modelling is a diagram that simply describes what you do and how you make a difference; short, medium and long term and it's useful for people who have to show how the work they are doing for individuals and communities are feeding into a bigger picture.

So for example, the difference you are making to local government or national government strategic outcomes or particular funder outcomes. That can become quite difficult to see how, for example, working with an individual increasing confidence leads into long term community wellbeing being just one example.

So in this course we teach you how to put together this simple diagram.
